Electric power transmission is the bulk movement of electrical energy from a generating site, such as a power plant, to an electrical substation. The

interconnected lines which facilitate this movement are known as a transmission network. This is distinct from the local wiring between high-voltage substations and customers, which is typically referred to as electric power distribution.

Although the workers in these industries are not employees of the electric power generation, transmission, and distribution industry, they often work near energized power lines. This subjects them to the risk of electrocution when: A boomed vehicle, truck, or other vehicle comes into contact with electric power distribution or transmission lines,

first through transmission systems, which consist of transmission lines that carry electric power at various voltage levels. A transmission system corresponds to a networked, meshed topology infrastructure, connecting generation and substations together into a grid that usually is defined at 100 kV or more.

generating plants, fuel and labor to operate these plants. Generation facilities are the first link in the chain in providing electricity to consumers. The transmission function moves electricity from generating plants over long distances to local service areas, such as your town or neighborhood.
